

SETTINGS AND SETUP OF PROJECT ENVIRONMENT

Setting up the server

1. Wamp server is the best option for viewing this project as it requires no additional steps apart from installation.
2. The server can be downloaded from <http://www.wampserver.com/en/>
3. After successful installation copy the 'captcha' folder to 'www' folder inside wamp installation directory.

Database Settings

Login to mysql with your root username and password (if exists).

Enter the command **create database captcha;** to create the database.

Use the command **use captcha;** to switch the database

The default credentials of the database are as follows

Database name: captcha

Username: captcha_user

Password: captcha

Change these credentials according to your root login in db_connection.php

1. The .sql file can be found in the inside 'captcha' folder.
2. Import database using command
 - **source /path_of_sql_file/file_name.sql**
3. After importing the database file into mysql the project is now ready to be viewed.
4. Fire up a browser and navigate to the url http://localhost/captcha/text_captcha/index.php to view or evaluate the CAPTCHA.
